SpanSet Edge Protectors protect and safeguard sensitive loads

Products and services around the topic load security are in the spotlight, when Spanset GmbH & Co. KG, Übach-Palenberg, makes its appearance at the IAA Nutzfahrzeuge (Commercial Vehicles) in Hannover from September 25 to October 02, 2014. In the development of new products SpanSet does not only rely on its know-how as a pioneer in load security. The experience of customers also flows into the design. Examples of this are the edge protection profiles KaSiPlus and LaWi, whereby weight, size, contact surface, stackability and geometry are the result of many discussions with industry and the people in the transport area.

KaSiPlus: Protection for sensitive paper rolls

The properties of KasiPlus were specified according to requirements of the paper and transport industries. That is why the edge protector offers optimal protection to sensitive paper roll edges and prevents mechanical damage. A chamfer and an inwardly directed edge protection profile protects the edge of the roll of paper effectively against pressure marks. The large contact surface of the KaSiPlus moreover leads to a very low contact pressure of less than 1,8 daN/cm² at 500 daN pre-tensioning force.

The construction reinforced with bridging pieces makes the KaSiPlus especially robust and warp resistant, and the polished strap re-directions allow an optimal power transmission when lashing down. In minus temperatures KasiPlus also offers advantages in comparison with conventional edge protectors: Thanks to the use of a special plastic it does not break, even when it falls down during loading.

KaSiPlus is universally deployable for the securing of upright and horizontal rolls of paper, it is easy to handle, stackable and therefore space-saving when stored away. Due to the increased demand there are economic advantages in the production, which Spanset will pass on to its customers with immediate effect by way of a revised pricing strategy.

LaWi: Universal long edge protection

LaWi is a versatile long edge protection in L-profile, with which loose load combinations can be combined and secured in one loading unit. The LaWi is especially suitable for delicate and sensitive freights such as roof tiles, planed timber beams, doors etc. The inside chamfer of the edge protector protects the loading edge, the large edge curvature preserves the lashing strap and optimizes the force direction. A particular feature of the plastic protector edge is its high torsional rigidity, which helps when bridging load gaps.

The utilized material - an impact-proof polyethylene - and a special interior honeycomb structure increase stability and robustness of the long edge protector. Thanks to the temperature-stable plastic LaWi is deployable between minus 40°C and plus 100°C. The large contact surface facilitates handling and reduces the danger, that the edge protector could fall off. The long edge protector is suitable for all strap widths and can be shortened to any length.

You can find further information in the internet under www.spanset.de or directly from SpanSet at the IAA Nutzfahrzeuge (Commercial Vehicles) 2014 in Hannover on the stand in hall 27 / E22.
